# BACKGROUND

Alzheimer's disease (AD) is a neurodegenerative disease affecting the elderly, which results in progressive impairment 25 of memory, language skills and severe behavioral deficits. Hallmarks of the disease include degeneration of cholinergic neurons in the cerebral cortex, hippocampus, basal forebrain and other regions of the brain important for memory and cognition. Other hallmarks of AD include neurofibrillary 30 tangles composed of hyperphosphorylated tau and accumulation of amyloid  $\beta$  peptide (A $\beta$ ). A $\beta$  is a 39-43 amino acid peptide produced in the brain by proteolytic processing of  $\beta$ -amyloid precursor protein (APP) by the  $\beta$ -amyloid cleaving enzyme (BACE) and gamma secretase which leads to 35 accumulation of A $\beta$  in the brain, where A $\beta$ 1-40 and 1-42 are the principal aggregate-forming species of A $\beta$ .

Schizophrenia is a debilitating psychiatric disorder characterized by a combination of negative (blunted affect, withdrawal, anhedonia) and positive (paranoia, hallucinations, 40 delusions) symptoms as well as marked cognitive deficits. While schizophrenia remains an idiopathic disorder, it appears to be produced by a complex interaction of biological, environmental, and genetic factors. Over 40 years ago it was found that phencyclidine (PCP) induces a psychotic state 45 in humans that is very similar to that observed in schizophrenic patients. The finding that the main mode of action of PCP is that of a non-competitive antagonist of the N-methyl-D-aspartate (NMDA) subtype of ionotropic glutamate receptor stimulated a series of studies that have led to the develop- 50 ment of the NMDA receptor hypofunction model of schizophrenia. Besides schizophrenia, dysfunction of glutamatergic pathways has been implicated in a number of disease states in the human central nervous system (CNS) including cognitive deficits, dementias, Parkinson's disease, 55 Alzheimer's disease and bipolar disorder.

NMDA receptor function can be modulated by activation of G Protein-Coupled Receptors (GPCRs) that are known to physically and/or functionally interact with the NMDA receptor. The NMDA receptor hypofunction hypothesis is a proposal to explain the underlying cause of schizophrenia. According to this hypothesis, any agent that can potentiate NMDA receptor currents, either directly by action on modulatory sites on the NMDA receptor (e.g., the glycine coagonist binding site) or indirectly by activation of GPCRs known to potentiate NMDA receptor function (e.g. the M<sub>1</sub> mAChR), has the potential to ameliorate the symptoms of

2

schizophrenia. In both preclinical and in clinical studies, Xanomeline, an  $M_1/M_4$  preferring orthosteric agonist has proved efficacious with regard to positive, negative and cognitive symptoms, indicating that  $M_1$  activation is a reasonable approach to the treatment of schizophrenia. More recently, the selective  $M_1$  allosteric agonist TBPB demonstrated efficacy in multiple preclinical models of schizophrenia.

Positive allosteric modulators are compounds that bind to a target, such as a receptor, and can enhance the affinity or efficacy of an orthosteric agonist. For example, a selective muscarinic M<sub>1</sub> positive allosteric modulator would preferentially bind to the muscarinic M<sub>1</sub> receptor which would result in an increased affinity at that receptor for acetylcholine (ACh), the endogenous agonist for the muscarinic M<sub>1</sub> recep-15 tor, or an increase in the efficacy induced by ACh. In some systems, the compound may also have an intrinsic activity to activate the receptor in the absence of orthosteric ligand. As another example, a dual M<sub>1</sub>/M<sub>4</sub> positive allosteric modulator would induce a potentiating effect at both the M<sub>1</sub> and M<sub>4</sub> 20 muscarinic receptors, but not necessarily to an identical extent at both receptors. Positive allosteric modulation (potentiation), therefore, can be an attractive mechanism for enhancing appropriate physiological receptor activation.

Cholinergic neurotransmission involves the activation of nicotinic acetylcholine receptors (nAChRs) or the muscarinic acetylcholine receptors (mAChRs) by the binding of the endogenous orthosteric agonist acetylcholine (ACh). Acetylcholinesterase inhibitors, which inhibit the hydrolysis of ACh, have been approved in the United States for use in the palliative, but not disease-modifying, treatment of the cognitive deficits in AD patients. An alternative approach to pharmacologically increase the effects of ACh could be accomplished through the use of positive allosteric modulators either alone or possibly in combination with other mAChR agonists. mAChRs are widely expressed throughout the body. The mAChRs are members of the family A GPCRs and include five subtypes, designated M<sub>1</sub>-M<sub>5</sub>. M<sub>1</sub>, M<sub>3</sub> and M<sub>5</sub> mainly couple to Gq and activate phospholipase C whereas M<sub>2</sub> and M<sub>4</sub> mainly couple to G<sub>i/o</sub> and associated effector systems. These five distinct mAChR subtypes have been identified in the mammalian central nervous system where they are prevalent and differentially expressed. M<sub>1</sub>-M<sub>5</sub> mAChRs have varying roles in cognitive, sensory, motor and autonomic functions. Activation of various muscarinic receptors, particularly the M<sub>1</sub> subtype, has been proposed as a mechanism to enhance cognition in disorders such as AD. Thus, without wishing to be bound by theory, it is believed that selective positive allosteric modulators of mAChR subtypes that regulate processes involved in cognitive function could prove superior to AChE inhibitors for treatment of AD and related disorders as it is postulated that these compounds would exhibit improved selectivity for specific mAChRs

Evidence suggests that the most prominent adverse effects of AChE inhibitors and other cholinergic agents are mediated by activation of peripheral M<sub>2</sub> and M<sub>3</sub> mAChRs and include bradycardia, GI distress, excessive salivation, and sweating. In contrast, M<sub>1</sub> has been viewed as the most likely subtype for mediating the effects on cognition, attention mechanisms, and sensory processing. Because of this, considerable effort has been focused on developing selective M<sub>1</sub> agonists and positive allosteric modulators for the treatment of AD. Unfortunately, these efforts have been largely unsuccessful because of an inability to develop compounds that are highly selective for the M<sub>1</sub> mAChR. Because of this, mAChR agonists that have been tested in clinical studies induce the same adverse effects of AChE inhibitors by activation of peripheral mAChRs. To fully understand the physiological roles of indi-

vidual mAChR subtypes and to further explore the therapeutic utility of mACh receptors in AD and other disorders, it can be important to develop compounds that are highly selective positive allosteric modulators of M<sub>1</sub> and other individual mAChR subtypes.

Previous attempts to develop activators that are highly selective for individual mAChR subtypes have failed because of the high conservation of the orthosteric ACh binding site. To circumvent problems associated with targeting the highly conserved orthosteric ACh site, a number of groups have shifted their focus to developing compounds that act at allosteric sites on mAChRs that are removed from the orthosteric site and are less highly conserved. This approach is proving to be successful in developing selective ligands for multiple 15 GPCR subtypes. In the case of mAChRs, a major goal has been to develop allosteric ligands that selectively increase activity of M<sub>1</sub> or other mAChR subtypes. Allosteric activators can include allosteric agonists, that act at a site removed from the orthosteric site to directly activate the receptor in the 20 absence of ACh as well as positive allosteric modulators (PAMs), which do not activate the receptor directly but potentiate activation of the receptor by the endogenous orthosteric agonist ACh. Also, it is possible for a single molecule to have both allosteric potentiator and allosteric agonist activity.

Phase III trials have shown that orthosteric mAChR activators can have efficacy in improving cognitive performance in AD patients. Moreover, data indicate that administration of M<sub>1</sub> activators decreases behavioral disturbances, including delusions, hallucinations, outbursts, and other symptoms in patients suffering from neurodegenerative diseases such as Alzheimer's disease. However, dose limiting adverse effects that may be due to lack of M<sub>1</sub> mAChR selectivity led to failed 35 launches of previous M<sub>1</sub> agonists. In some cases, evidence suggests that mAChR activation also has the potential to be disease-modifying in that these agents may lower A $\beta$  in AD patients. Interestingly, the M<sub>1</sub>-selective allosteric agonist TBPB was found to display effects on the processing of APP 40 toward the non-amyloidogenic pathway and decrease Aß 1-40 and 1-42 production in vitro. These data suggest that selective activation of M<sub>1</sub> may provide a novel approach for Alzheimer's disease.

Despite advances in muscarinic receptor (mAChR) research, there is still a scarcity of compounds that are potent, efficacious and selective positive allosteric modulators of the M<sub>1</sub> mAChR that are also effective in the treatment of neurological and psychiatric disorders associated with cholinergic activity, or other neurologic diseases in which the muscarinic M<sub>1</sub> receptor may be involved. These needs and other needs are addressed by the present invention.

While aspects of the present invention can be described and claimed in a particular statutory class, such as the system statutory class, this is for convenience only and one of skill in the art will understand that each aspect of the present invention can be described and claimed in any statutory class. Unless otherwise expressly stated, it is in no way intended that any method or aspect set forth herein be construed as 10 requiring that its steps be performed in a specific order. Accordingly, where a method claim does not specifically state in the claims or descriptions that the steps are to be limited to a specific order, it is no way intended that an order be inferred, in any respect. This holds for any possible non-express basis for interpretation, including matters of logic with respect to arrangement of steps or operational flow, plain meaning derived from grammatical organization or punctuation, or the number or type of aspects described in the specification.

Additional advantages of the invention will be set forth in 20 part in the description which follows, and in part will be obvious from the description, or can be learned by practice of the invention. The advantages of the invention will be realized and attained by means of the elements and combinations particularly pointed out in the appended claims. It is to be 25 understood that both the foregoing general description and the following detailed description are exemplary and explanatory only and are not restrictive of the invention, as claimed.

## DESCRIPTION

The present invention can be understood more readily by reference to the following detailed description of the invention and the Examples included therein.

Before the present compounds, compositions, articles, systems, devices, and/or methods are disclosed and described, it is to be understood that they are not limited to specific synthetic methods unless otherwise specified, or to particular reagents unless otherwise specified, as such may, of course, 40 cally stated to the contrary, is based on the total weight of the vary. It is also to be understood that the terminology used herein is for the purpose of describing particular aspects only and is not intended to be limiting. Although any methods and materials similar or equivalent to those described herein can be used in the practice or testing of the present invention, 45 example methods and materials are now described.

All publications mentioned herein are incorporated herein by reference to disclose and describe the methods and/or materials in connection with which the publications are cited. The publications discussed herein are provided solely for 50 their disclosure prior to the filing date of the present application. Nothing herein is to be construed as an admission that the present invention is not entitled to antedate such publication by virtue of prior invention. Further, the dates of publication provided herein can be different from the actual pub- 55 lication dates, which can require independent confirmation.

#### A. DEFINITIONS

As used herein, nomenclature for compounds, including 60 organic compounds, can be given using common names, IUPAC, IUBMB, or CAS recommendations for nomenclature. When one or more stereochemical features are present, Cahn-Ingold-Prelog rules for stereochemistry can be employed to designate stereochemical priority, E/Z specification, and the like. One of skill in the art can readily ascertain the structure of a compound If given a name, either by sys-

temic reduction of the compound structure using naming conventions, or by commercially available software, such as CHEMDRAW<sup>TM</sup> (Cambridgesoft Corporation, U.S.A.).

As used in the specification and the appended claims, the singular forms "a," "an" and "the" include plural referents unless the context clearly dictates otherwise. Thus, for example, reference to "a functional group," "an alkyl," or "a residue" includes mixtures of two or more such functional groups, alkyls, or residues, and the like.

Ranges can be expressed herein as from "about" one particular value, and/or to "about" another particular value. When such a range is expressed, a further aspect includes from the one particular value and/or to the other particular value. Similarly, when values are expressed as approximations, by use of the antecedent "about," it will be understood that the particular value forms a further aspect. It will be further understood that the endpoints of each of the ranges are significant both in relation to the other endpoint, and independently of the other endpoint. It is also understood that there are a number of values disclosed herein, and that each value is also herein disclosed as "about" that particular value in addition to the value itself. For example, if the value "10" is disclosed, then "about 10" is also disclosed. It is also understood that each unit between two particular units are also disclosed. For example, if 10 and 15 are disclosed, then 11, 12, 13, and 14 are also disclosed.

References in the specification and concluding claims to parts by weight of a particular element or component in a composition denotes the weight relationship between the element or component and any other elements or components in the composition or article for which a part by weight is expressed. Thus, in a compound containing 2 parts by weight of component X and 5 parts by weight component Y, X and Y are present at a weight ratio of 2:5, and are present in such ratio regardless of whether additional components are contained in the compound.

A weight percent (wt. %) of a component, unless specififormulation or composition in which the component is

As used herein, the terms "optional" or "optionally" means that the subsequently described event or circumstance can or can not occur, and that the description includes instances where said event or circumstance occurs and instances where it does not.

As used herein, the term "allosteric site" refers to a ligand binding site that is topographically distinct from the orthosteric binding site.

As used herein, the term "modulator" refers to a molecular entity (e.g., but not limited to, a ligand and a disclosed compound) that modulates the activity of the target receptor protein.

As used herein, the term "ligand" refers to a natural or synthetic molecular entity that is capable of associating or binding to a receptor to form a complex and mediate, prevent or modify a biological effect. Thus, the term "ligand" encompasses allosteric modulators, inhibitors, activators, agonists, antagonists, natural substrates and analogs of natural sub-

As used herein, the terms "natural ligand" and "endogenous ligand" are used interchangeably, and refer to a naturally occurring ligand, found in nature, which binds to a receptor.

As used herein, the term "orthosteric site" refers to the primary binding site on a receptor that is recognized by the

endogenous ligand or agonist for that receptor. For example, the orthosteric site in the mAChR  $\mathbf{M}_1$  receptor is the site that acetylcholine binds.

As used herein, the term "mAChR M<sub>1</sub> receptor positive allosteric modulator" refers to any exogenously administered compound or agent that directly or indirectly augments the activity of the mAChR M<sub>1</sub> receptor in the presence or in the absence of acetylcholine, or another agonist, in an animal, in particular a mammal, for example a human. In one aspect, a mAChR M<sub>1</sub> receptor positive allosteric modulator increases the activity of the mAChR M<sub>1</sub> receptor in a cell in the presence of extracellular acetylcholine. The cell can be Chinese hamster ovary (CHO-K1) cells transfected with human mAChR M<sub>1</sub>. The cell can be Chinese hamster ovary (CHO-K1) cells transfected with rat mAChR M<sub>1</sub> receptor. The cell can be Chinese hamster ovary (CHO-K1) cells transfected with a mammalian mAChR M<sub>1</sub>. The term "mAChR M<sub>1</sub> receptor positive allosteric modulator" includes a compound that is a "mAChR M<sub>1</sub> receptor allosteric potentiator" or a "mAChR <sub>20</sub> M<sub>1</sub> receptor allosteric agonist," as well as a compound that has mixed activity comprising pharmacology of both an "mAChR M<sub>1</sub> receptor allosteric potentiator" and an "mAChR M<sub>1</sub> receptor allosteric agonist". The term "mAChR M<sub>1</sub> receptor positive allosteric modulator also includes a compound 25 that is a "mAChR M<sub>1</sub> receptor allosteric enhancer."

As used herein, the term "mAChR M<sub>1</sub> receptor allosteric potentiator" refers to any exogenously administered compound or agent that directly or indirectly augments the response produced by the endogenous ligand (such as acetyl-30 choline) when the endogenous ligand binds to the orthosteric site of the mAChR M<sub>1</sub> receptor in an animal, in particular a mammal, for example a human. The mAChR M1 receptor allosteric potentiator binds to a site other than the orthosteric site, that is, an allosteric site, and positively augments the 35 response of the receptor to an agonist or the endogenous ligand. In one aspect, an allosteric potentiator does not induce desensitization of the receptor, activity of a compound as an mAChR M<sub>1</sub> receptor allosteric potentiator provides advantages over the use of a pure mAChR M<sub>1</sub> receptor orthosteric 40 agonist. Such advantages can include, for example, increased safety margin, higher tolerability, diminished potential for abuse, and reduced toxicity.

As used herein, the term "mAChR  $\rm M_1$  receptor allosteric enhancer" refers to any exogenously administered compound 45 or agent that directly or indirectly augments the response produced by the endogenous ligand (such as acetylcholine) in an animal, in particular a mammal, for example a human. In one aspect, the allosteric enhancer increases the affinity of the natural ligand or agonist for the orthosteric site. In another aspect, an allosteric enhancer increases the agonist efficacy. The mAChR  $\rm M_1$  receptor allosteric potentiator binds to a site other than the orthosteric site, that is, an allosteric site, and positively augments the response of the receptor to an agonist or the endogenous ligand. An allosteric enhancer has no effect 55 on the receptor by itself and requires the presence of an agonist or the natural ligand to realize a receptor effect.

As used herein, the term "mAChR  $M_1$  receptor allosteric agonist" refers to any exogenously administered compound or agent that directly activates the activity of the mAChR  $M_1$  60 receptor in the absence of the endogenous ligand (such as acetylcholine) in an animal, in particular a mammal, for example a human. The mAChR  $M_1$  receptor allosteric agonist binds to a site that is distinct from the orthosteric acetylcholine site of the mAChR  $M_1$  receptor. Because it does not 65 require the presence of the endogenous ligand, activity of a compound as an mAChR  $M_1$  receptor allosteric agonist pro-

10

vides advantages over the use of a pure mAChR  $M_1$  receptor allosteric potentiator, such as more rapid onset of action.

As used herein, the term "mAChR  $M_1$  receptor neutral allosteric ligand" refers to any exogenously administered compound or agent that binds to an allosteric site without affecting the binding or function of agonists or the natural ligand at the orthosteric site in an animal, in particular a mammal, for example a human. However, a neutral allosteric ligand can block the action of other allosteric modulators that act via the same site.

As used herein, the term "subject" can be a vertebrate, such as a mammal, a fish, a bird, a reptile, or an amphibian. Thus, the subject of the herein disclosed methods can be a human, non-human primate, horse, pig, rabbit, dog, sheep, goat, cow, cat, guinea pig or rodent. The term does not denote a particular age or sex. Thus, adult and newborn subjects, as well as fetuses, whether male or female, are intended to be covered. In one aspect, the subject is a mammal. A patient refers to a subject afflicted with a disease or disorder. The term "patient" includes human and veterinary subjects. In some aspects of the disclosed methods, the subject has been diagnosed with a need for treatment of one or more neurological and/or psychiatric disorder associated with muscarinic acetylcholine receptor dysfunction prior to the administering step. In some aspects of the disclosed method, the subject has been diagnosed with a need for positive allosteric modulation of muscarinic acetylcholine receptor activity prior to the administering step. In some aspects of the disclosed method, the subject has been diagnosed with a need for partial agonism of muscarinic acetylcholine receptor activity prior to the administering step. In some aspects of the disclosed method, the subject has been diagnosed with a neurological and/or psychiatric disorder, e.g. schizophrenia, Alzheimer's disease, a cognitive disorder, or neuropathic pain prior to the administering step. In some aspects of the disclosed method, the subject has been identified with a disorder treatable by activation of the mAChR M<sub>1</sub> receptor and/or or a need for activation/agonism of mAChR M<sub>1</sub> activity prior to the administering step. In some aspects of the disclosed method, the subject has been identified with anxiety or a related disorder prior to the administering step. In one aspect, a subject can be treated prophylactically with a compound or composition disclosed herein, as discussed herein elsewhere.

As used herein, the term "treatment" refers to the medical management of a patient with the intent to cure, ameliorate, stabilize, or prevent a disease, pathological condition, or disorder. This term includes active treatment, that is, treatment directed specifically toward the improvement of a disease, pathological condition, or disorder, and also includes causal treatment, that is, treatment directed toward removal of the cause of the associated disease, pathological condition, or disorder. In addition, this term includes palliative treatment, that is, treatment designed for the relief of symptoms rather than the curing of the disease, pathological condition, or disorder; preventative treatment, that is, treatment directed to minimizing or partially or completely inhibiting the development of the associated disease, pathological condition, or disorder; and supportive treatment, that is, treatment employed to supplement another specific therapy directed toward the improvement of the associated disease, pathological condition, or disorder. In various aspects, the term covers any treatment of a subject, including a mammal (e.g., a human), and includes: (i) preventing the disease from occurring in a subject that can be predisposed to the disease but has not yet been diagnosed as having it; (ii) inhibiting the disease, i.e., arresting its development; or (iii) relieving the disease, i.e., causing regression of the disease. In one aspect, the

subject is a mammal such as a primate, and, in a further aspect, the subject is a human. The term "subject" also includes domesticated animals (e.g., cats, dogs, etc.), livestock (e.g., cattle, horses, pigs, sheep, goats, etc.), and laboratory animals (e.g., mouse, rabbit, rat, guinea pig, fruit fly, 5 etc.).

As used herein, the term "prevent" or "preventing" refers to precluding, averting, obviating, forestalling, stopping, or hindering something from happening, especially by advance action. It is understood that where reduce, inhibit or prevent 10 are used herein, unless specifically indicated otherwise, the use of the other two words is also expressly disclosed.

As used herein, the term "diagnosed" means having been subjected to a physical examination by a person of skill, for example, a physician, and found to have a condition that can 15 be diagnosed or treated by the compounds, compositions, or methods disclosed herein. For example, "diagnosed with a disorder treatable by modulation of mAChR M<sub>1</sub>" means having been subjected to a physical examination by a person of skill, for example, a physician, and found to have a condition 20 that can be diagnosed or treated by a compound or composition that can modulate mAChR  $M_1$ . As a further example, "diagnosed with a need for modulation of mAChR M<sub>1</sub>" refers to having been subjected to a physical examination by a person of skill, for example, a physician, and found to have a 25 condition characterized by mAChR M<sub>1</sub> activity. Such a diagnosis can be in reference to a disorder, such as a neurodegenerative disease, and the like, as discussed herein. For example, the term "diagnosed with a need for positive allosteric modulation of muscarinic acetylcholine receptor activity" refers to 30 having been subjected to a physical examination by a person of skill, for example, a physician, and found to have a condition that can be diagnosed or treated by positive allosteric modulation of muscarinic acetylcholine receptor activity. For example, "diagnosed with a need for partial agonism of mus- 35 carinic acetylcholine receptor activity" means having been subjected to a physical examination by a person of skill, for example, a physician, and found to have a condition that can be diagnosed or treated by partial agonism of muscarinic acetylcholine receptor activity. For example, "diagnosed with 40 a need for treatment of one or more neurological and/or psychiatric disorder associated with acetylcholine dysfunction" means having been subjected to a physical examination by a person of skill, for example, a physician, and found to have one or more neurological and/or psychiatric disorder 45 associated with acetycholine dysfunction.

As used herein, the phrase "identified to be in need of treatment for a disorder," or the like, refers to selection of a subject based upon need for treatment of the disorder. For example, a subject can be identified as having a need for treatment of a disorder (e.g., a disorder related to mAChR M<sub>1</sub> activity) based upon an earlier diagnosis by a person of skill and thereafter subjected to treatment for the disorder. It is contemplated that the identification can, in one aspect, be performed by a person different from the person making the 55 diagnosis. It is also contemplated, in a further aspect, that the administration can be performed by one who subsequently performed the administration.

As used herein, the terms "administering" and "administration" refer to any method of providing a pharmaceutical 60 preparation to a subject. Such methods are well known to those skilled in the art and include, but are not limited to, oral administration, transdermal administration, administration by inhalation, nasal administration, topical administration, intravaginal administration, ophthalmic administration, 65 intraaural administration, intracerebral administration, rectal administration, sublingual administration, buccal administra-

12

tion, and parenteral administration, including injectable such as intravenous administration, intra-arterial administration, intramuscular administration, and subcutaneous administration. Administration can be continuous or intermittent. In various aspects, a preparation can be administered therapeutically; that is, administered to treat an existing disease or condition. In further various aspects, a preparation can be administered prophylactically; that is, administered for prevention of a disease or condition.

The term "contacting" as used herein refers to bringing a disclosed compound and a cell, a target receptor (e.g. a muscarinic acetylcholine receptor), or other biological entity together in such a manner that the compound can affect the activity of the target, either directly; i.e., by interacting with the target itself, or indirectly; i.e., by interacting with another molecule, co-factor, factor, or protein on which the activity of the target is dependent.

As used herein, the terms "effective amount" and "amount effective" refer to an amount that is sufficient to achieve the desired result or to have an effect on an undesired condition. For example, a "therapeutically effective amount" refers to an amount that is sufficient to achieve the desired therapeutic result or to have an effect on undesired symptoms, but is generally insufficient to cause adverse side affects. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration; the route of administration; the rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed and like factors well known in the medical arts. For example, it is well within the skill of the art to start doses of a compound at levels lower than those required to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved. If desired, the effective daily dose can be divided into multiple doses for purposes of administration. Consequently, single dose compositions can contain such amounts or submultiples thereof to make up the daily dose. The dosage can be adjusted by the individual physician in the event of any contraindications. Dosage can vary, and can be administered in one or more dose administrations daily, for one or several days. Guidance can be found in the literature for appropriate dosages for given classes of pharmaceutical products. In further various aspects, a preparation can be administered in a "prophylactically effective amount"; that is, an amount effective for prevention of a disease or condition.

As used herein, "kit" means a collection of at least two components constituting the kit. Together, the components constitute a functional unit for a given purpose. Individual member components may be physically packaged together or separately. For example, a kit comprising an instruction for using the kit may or may not physically include the instruction with other individual member components. Instead, the instruction can be supplied as a separate member component, either in a paper form or an electronic form which may be supplied on computer readable memory device or downloaded from an internet website, or as recorded presentation.

As used herein, "instruction(s)" means documents describing relevant materials or methodologies pertaining to a kit. These materials may include any combination of the following: background information, list of components and their availability information (purchase information, etc.), brief or detailed protocols for using the kit, trouble-shooting, references, technical support, and any other related documents.

Instructions can be supplied with the kit or as a separate member component, either as a paper form or an electronic form which may be supplied on computer readable memory device or downloaded from an internet website, or as recorded presentation. Instructions can comprise one or multiple documents, and are meant to include future updates.

As used herein, the terms "therapeutic agent" include any synthetic or naturally occurring biologically active compound or composition of matter which, when administered to an organism (human or nonhuman animal), induces a desired pharmacologic, immunogenic, and/or physiologic effect by local and/or systemic action. The term therefore encompasses those compounds or chemicals traditionally regarded as drugs, vaccines, and biopharmaceuticals including molecules such as proteins, peptides, hormones, nucleic acids, gene constructs and the like. Examples of therapeutic agents are described in well-known literature references such as the Merck Index (14 th edition), the Physicians' Desk Reference (64 th edition), and The Pharmacological Basis of Therapeutics (12 th edition), and they include, without limitation, 20 medicaments; vitamins; mineral supplements; substances used for the treatment, prevention, diagnosis, cure or mitigation of a disease or illness; substances that affect the structure or function of the body, or pro-drugs, which become biologically active or more active after they have been placed in a 25 physiological environment. For example, the term "therapeutic agent" includes compounds or compositions for use in all of the major therapeutic areas including, but not limited to, adjuvants; anti-infectives such as antibiotics and antiviral agents; analgesics and analgesic combinations, anorexics, 30 anti-inflammatory agents, anti-epileptics, local and general anesthetics, hypnotics, sedatives, antipsychotic agents, neuroleptic agents, antidepressants, anxiolytics, antagonists, neuron blocking agents, anticholinergic and cholinomimetic agents, antimuscarinic and muscarinic agents, antiadrener- 35 gics, antiarrhythmics, antihypertensive agents, hormones, and nutrients, antiarthritics, antiasthmatic agents, anticonvulsants, antihistamines, antinauseants, antineoplastics, antipruritics, antipyretics; antispasmodics, cardiovascular preparations (including calcium channel blockers, beta-blockers, 40 beta-agonists and antiarrythmics), antihypertensives, diuretics, vasodilators; central nervous system stimulants; cough and cold preparations; decongestants; diagnostics; hormones; bone growth stimulants and bone resorption inhibitors; immunosuppressives; muscle relaxants; psychostimu- 45 lants; sedatives; tranquilizers; proteins, peptides, and fragments thereof (whether naturally occurring, chemically synthesized or recombinantly produced); and nucleic acid molecules (polymeric forms of two or more nucleotides, either ribonucleotides (RNA) or deoxyribonucleotides 50 (DNA) including both double- and single-stranded molecules, gene constructs, expression vectors, antisense molecules and the like), small molecules (e.g., doxorubicin) and other biologically active macromolecules such as, for example, proteins and enzymes. The agent may be a biologi- 55 cally active agent used in medical, including veterinary, applications and in agriculture, such as with plants, as well as other areas. The term therapeutic agent also includes without limitation, medicaments; vitamins; mineral supplements; substances used for the treatment, prevention, diagnosis, cure 60 or mitigation of disease or illness; or substances which affect the structure or function of the body; or pro-drugs, which become biologically active or more active after they have been placed in a predetermined physiological environment.

As used herein, "EC<sub>50</sub>," is intended to refer to the concentration of a substance (e.g., a compound or a drug) that is required for 50% activation or enhancement of a biological

14

process, or component of a process, including a protein, subunit, organelle, ribonucleoprotein, etc. For example,  $EC_{50}$  can refer to the concentration of agonist that provokes a response halfway between the baseline and maximum response in an in vitro assay. Such in vitro assay systems frequently utilize a cell line that either expresses endogenously a target of interest, or has been transfected with a suitable expression vector that directs expression of a recombinant form of the target. For example, the  $EC_{50}$  for mAChR  $M_1$  can be determined using Chinese hamster ovary (CHO-K1) cells transfected with human mAChR  $M_1$ . Alternatively, the  $EC_{50}$  for mAChR  $M_1$  can be determined using Chinese hamster ovary (CHO-K1) cells transfected with rat mAChR  $M_1$ . In another example, the  $EC_{50}$  for mAChR  $M_1$  can be determined using Chinese hamster ovary (CHO-K1) cells transfected with a mammalian mAChR  $M_1$ .

mammalian mAChR  $\rm M_1$ . As used herein, "IC $_{50}$ ," is intended to refer to the concentration of a substance (e.g., a compound or a drug) that is required for 50% inhibition of a biological process, or component of a process, including a protein, subunit, organelle, ribonucleoprotein, etc. For example, IC<sub>50</sub> refers to the half maximal (50%) inhibitory concentration (IC) of a substance as determined in a suitable assay. For example, an IC<sub>50</sub> for mAChR M<sub>1</sub> receptor can be determined in an in vitro assay system. Frequently, receptor assays, including suitable assays for mAChR M<sub>1</sub>, make use of a suitable cell-line, e.g. a cell line that either expresses endogenously a target of interest, or has been transfected with a suitable expression vector that directs expression of a recombinant form of the target such as mAChR M<sub>1</sub>. For example, the IC<sub>50</sub> for mAChR M<sub>1</sub> can be determined using Chinese hamster ovary (CHO-K1) cells transfected with human mAChR M<sub>1</sub>. Alternatively, the IC<sub>50</sub> for mAChR M<sub>1</sub> can be determined using Chinese hamster ovary (CHO-K1) cells transfected with rat mAChR M<sub>1</sub>. In another example, the  $IC_{50}$  for mAChR  $M_1$  can be determined using Chinese hamster ovary (CHO-K1) cells transfected with a mammalian mAChR M<sub>1</sub>.

The term "pharmaceutically acceptable" describes a material that is not biologically or otherwise undesirable, i.e., without causing an unacceptable level of undesirable biological effects or interacting in a deleterious manner.

As used herein, the term "derivative" refers to a compound having a structure derived from the structure of a parent compound (e.g., a compound disclosed herein) and whose structure is sufficiently similar to those disclosed herein and based upon that similarity, would be expected by one skilled in the art to exhibit the same or similar activities and utilities as the claimed compounds, or to induce, as a precursor, the same or similar activities and utilities as the claimed compounds. Exemplary derivatives include salts, esters, amides, salts of esters or amides, and N-oxides of a parent compound.

As used herein, the term "pharmaceutically acceptable carrier" refers to sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, as well as sterile powders for reconstitution into sterile injectable solutions or dispersions just prior to use. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (such as glycerol, propylene glycol, polyethylene glycol and the like), carboxymethylcellulose and suitable mixtures thereof, vegetable oils (such as olive oil) and injectable organic esters such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of coating materials such as lecithin, by the maintenance of the required particle size in the case of dispersions and by the use of surfactants. These compositions can also contain adjuvants such as preservatives, wetting agents, emulsifying agents and dispersing agents. Prevention of the action of microorgan-

isms can be ensured by the inclusion of various antibacterial and antifungal agents such as paraben, chlorobutanol, phenol, sorbic acid and the like. It can also be desirable to include isotonic agents such as sugars, sodium chloride and the like. Prolonged absorption of the injectable pharmaceutical form can be brought about by the inclusion of agents, such as aluminum monostearate and gelatin, which delay absorption. Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide, poly(orthoesters) and poly(anhydrides). Depending upon the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissues. The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other 20 sterile injectable media just prior to use. Suitable inert carriers can include sugars such as lactose. Desirably, at least 95% by weight of the particles of the active ingredient have an effective particle size in the range of 0.01 to 10 micrometers.

A residue of a chemical species, as used in the specification 25 and concluding claims, refers to the moiety that is the resulting product of the chemical species in a particular reaction scheme or subsequent formulation or chemical product, regardless of whether the moiety is actually obtained from the chemical species. Thus, an ethylene glycol residue in a polyester refers to one or more —OCH<sub>2</sub>CH<sub>2</sub>O— units in the polyester, regardless of whether ethylene glycol was used to prepare the polyester. Similarly, a sebacic acid residue in a polyester refers to one or more —CO(CH<sub>2</sub>)<sub>8</sub>CO— moieties in the polyester, regardless of whether the residue is obtained 35 by reacting sebacic acid or an ester thereof to obtain the polyester.

As used herein, the term "substituted" is contemplated to include all permissible substituents of organic compounds. In a broad aspect, the permissible substituents include acyclic 40 and cyclic, branched and unbranched, carbocyclic and heterocyclic, and aromatic and nonaromatic substituents of organic compounds. Illustrative substituents include, for example, those described below. The permissible substituents can be one or more and the same or different for appropriate 45 organic compounds. For purposes of this disclosure, the heteroatoms, such as nitrogen, can have hydrogen substituents and/or any permissible substituents of organic compounds described herein which satisfy the valences of the heteroatoms. This disclosure is not intended to be limited in any 50 manner by the permissible substituents of organic compounds. Also, the terms "substitution" or "substituted with" include the implicit proviso that such substitution is in accordance with permitted valence of the substituted atom and the substituent, and that the substitution results in a stable compound, e.g., a compound that does not spontaneously undergo transformation such as by rearrangement, cyclization, elimination, etc. It is also contemplated that, in certain aspects, unless expressly indicated to the contrary, individual substituents can be further optionally substituted (i.e., further substi- 60 tuted or unsubstituted).

In defining various terms, "A¹," "A²," "A³," and "A⁴" are used herein as generic symbols to represent various specific substituents. These symbols can be any substituent, not limited to those disclosed herein, and when they are defined to be 65 certain substituents in one instance, they can, in another instance, be defined as some other substituents.

16

The term "aliphatic" or "aliphatic group", as used herein, denotes a hydrocarbon moiety that may be straight-chain (i.e., unbranched), branched, or cyclic (including fused, bridging, and spirofused polycyclic) and may be completely saturated or may contain one or more units of unsaturation, but which is not aromatic. Unless otherwise specified, aliphatic groups contain 1-20 carbon atoms. Aliphatic groups include, but are not limited to, linear or branched, alkyl, alkenyl, and alkynyl groups, and hybrids thereof such as (cycloalkyl)alkyl, (cycloalkenyl)alkyl or (cycloalkyl)alkenyl.

The term "alkyl" as used herein is a branched or unbranched saturated hydrocarbon group of 1 to 24 carbon atoms, such as methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, s-butyl, t-butyl, n-pentyl, isopentyl, s-pentyl, neopentyl, hexyl, heptyl, octyl, nonyl, decyl, dodecyl, tetradecyl, hexadecyl, eicosyl, tetracosyl, and the like. The alkyl group is acyclic. The alkyl group can be branched or unbranched. The alkyl group can also be substituted or unsubstituted. A "lower alkyl" group is an alkyl group containing from one to six (e.g., from one to four) carbon atoms.

Throughout the specification "alkyl" is generally used to refer to both unsubstituted alkyl groups and substituted alkyl groups; however, substituted alkyl groups are also specifically referred to herein by identifying the specific substituent(s) on the alkyl group. The term "alkoxyalkyl" specifically refers to an alkyl group that is substituted with one or more alkoxy groups, as described below. The term "alkylamino" specifically refers to an alkyl group that is substituted with one or more amino groups, as described below, and the like. When "alkyl" is used in one instance and a specific term such as "alkylalcohol" is used in another, it is not meant to imply that the term "alkyl" does not also refer to specific terms such as "alkylalcohol" and the like.

This practice is also used for other groups described herein. That is, while a term such as "cycloalkyl" refers to both unsubstituted and substituted cycloalkyl moieties, the substituted moieties can, in addition, be specifically identified herein; for example, a particular substituted cycloalkyl can be referred to as, e.g., an "alkylcycloalkyl." Similarly, a substituted alkoxy can be specifically referred to as, e.g., a "halogenated alkoxy," a particular substituted alkenyl can be, e.g., an "alkenylalcohol," and the like. Again, the practice of using a general term, such as "cycloalkyl," and a specific term, such as "alkylcycloalkyl," is not meant to imply that the general term does not also include the specific term.

The term "leaving group" refers to an atom (or a group of atoms) with electron withdrawing ability that can be displaced as a stable species, taking with it the bonding electrons. Examples of suitable leaving groups include halides and sulfonate esters, including, but not limited to, triflate, mesylate, tosylate, and brosylate.

The terms "hydrolysable group" and "hydrolysable moiety" refer to a functional group capable of undergoing hydrolysis, e.g., under basic or acidic conditions. Examples of hydrolysable residues include, without limitation, acid halides, activated carboxylic acids, and various protecting groups known in the art (see, for example, "Protective Groups in Organic Synthesis," T. W. Greene, P. G. M. Wuts, Wiley-Interscience, 1999).

The term "organic residue" defines a carbon containing residue, i.e., a residue comprising at least one carbon atom, and includes but is not limited to the carbon-containing groups, residues, or radicals defined hereinabove. Organic residues can contain various heteroatoms, or be bonded to another molecule through a heteroatom, including oxygen, nitrogen, sulfur, phosphorus, or the like. Examples of organic residues include but are not limited alkyl or substituted alkyls, alkoxy or substituted alkoxy, mono or di-substituted amino, amide groups, etc. Organic residues can preferably comprise 1 to 18 carbon atoms, 1 to 15, carbon atoms, 1 to 12 carbon atoms, 1 to 8 carbon atoms, 1 to 6 carbon atoms, or 1 to 4 carbon atoms. In a further aspect, an organic residue can comprise 2 to 18 carbon atoms, 2 to 15, carbon atoms, 2 to 12 carbon atoms, 2 to 8 carbon atoms, 2 to 4 carbon atoms, or 2 to 4 carbon atoms.

A very close synonym of the term "residue" is the term "radical," which as used in the specification and concluding claims, refers to a fragment, group, or substructure of a molecule described herein, regardless of how the molecule is prepared. For example, a 2,4-thiazolidinedione radical in a particular compound has the structure:

regardless of whether thiazolidinedione is used to prepare the 55 compound. In some embodiments the radical (for example an alkyl) can be further modified (i.e., substituted alkyl) by having bonded thereto one or more "substituent radicals." The number of atoms in a given radical is not critical to the present invention unless it is indicated to the contrary elsewhere 60 herein.

"Organic radicals," as the term is defined and used herein, contain one or more carbon atoms. An organic radical can have, for example, 1-26 carbon atoms, 1-18 carbon atoms, 1-12 carbon atoms, 1-8 carbon atoms, 1-6 carbon atoms, or 65 1-4 carbon atoms. In a further aspect, an organic radical can have 2-26 carbon atoms, 2-18 carbon atoms, 2-12 carbon

atoms, 2-8 carbon atoms, 2-6 carbon atoms, or 2-4 carbon atoms. Organic radicals often have hydrogen bound to at least some of the carbon atoms of the organic radical. One example, of an organic radical that comprises no inorganic atoms is a 5,6,7,8-tetrahydro-2-naphthyl radical. In some embodiments, an organic radical can contain 1-10 inorganic heteroatoms bound thereto or therein, including halogens, oxygen, sulfur, nitrogen, phosphorus, and the like. Examples of organic radicals include but are not limited to an alkyl, substituted alkyl, cycloalkyl, substituted cycloalkyl, monosubstituted amino, di-substituted amino, acyloxy, cyano, carboxy, carboalkoxy, alkylcarboxamide, substituted alkylcardialkylcarboxamide, boxamide. dialkylcarboxamide, alkylsulfonyl, alkylsulfinyl, thioalkyl, thiohaloalkyl, alkoxy, substituted alkoxy, haloalkyl, haloalkoxy, aryl, substituted aryl, heteroaryl, heterocyclic, or substituted heterocyclic radicals, wherein the terms are defined elsewhere herein. A few non-limiting examples of organic radicals that include heteroatoms include alkoxy radicals, trifluoromethoxy radicals, acetoxy radicals, dimethylamino radicals and the like.

"Inorganic radicals," as the term is defined and used herein, contain no carbon atoms and therefore comprise only atoms other than carbon. Inorganic radicals comprise bonded combinations of atoms selected from hydrogen, nitrogen, oxygen, silicon, phosphorus, sulfur, selenium, and halogens such as fluorine, chlorine, bromine, and iodine, which can be present individually or bonded together in their chemically stable combinations. Inorganic radicals have 10 or fewer, or preferably one to six or one to four inorganic atoms as listed above bonded together. Examples of inorganic radicals include, but not limited to, amino, hydroxy, halogens, nitro, thiol, sulfate, phosphate, and like commonly known inorganic radicals. The inorganic radicals do not have bonded therein the metallic elements of the periodic table (such as the alkali metals, alkaline earth metals, transition metals, lanthanide metals, or actinide metals), although such metal ions can sometimes serve as a pharmaceutically acceptable cation for anionic inorganic radicals such as a sulfate, phosphate, or like anionic inorganic radical. Inorganic radicals do not comprise metalloids elements such as boron, aluminum, gallium, germanium, arsenic, tin, lead, or tellurium, or the noble gas elements, unless otherwise specifically indicated elsewhere herein.

Compounds described herein can contain one or more double bonds and, thus, potentially give rise to cis/trans (E/Z) isomers, as well as other conformational isomers. Unless stated to the contrary, the invention includes all such possible isomers, as well as mixtures of such isomers.

Unless stated to the contrary, a formula with chemical bonds shown only as solid lines and not as wedges or dashed lines contemplates each possible isomer, e.g., each enantiomer and diastereomer, and a mixture of isomers, such as a racemic or scalemic mixture. Compounds described herein can contain one or more asymmetric centers and, thus, potentially give rise to diastereomers and optical isomers. Unless stated to the contrary, the present invention includes all such possible diastereomers as well as their racemic mixtures, their substantially pure resolved enantiomers, all possible geometric isomers, and pharmaceutically acceptable salts thereof. Mixtures of stereoisomers, as well as isolated specific stereoisomers, are also included. During the course of the synthetic procedures used to prepare such compounds, or in using racemization or epimerization procedures known to those skilled in the art, the products of such procedures can be a mixture of stereoisomers.

Many organic compounds exist in optically active forms having the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L or R and S are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and 1 or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or meaning that the compound is levorotatory. A compound prefixed with (+) or d is dextrorotatory. For a given chemical structure, these compounds, called stereoisomers, are identical except 10 that they are non-superimposable mirror images of one another. A specific stereoisomer can also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture. Many of the compounds 15 described herein can have one or more chiral centers and therefore can exist in different enantiomeric forms. If desired, a chiral carbon can be designated with an asterisk (\*). When bonds to the chiral carbon are depicted as straight lines in the disclosed formulas, it is understood that both the (R) and (S) 20 configurations of the chiral carbon, and hence both enantiomers and mixtures thereof, are embraced within the formula. As is used in the art, when it is desired to specify the absolute configuration about a chiral carbon, one of the bonds to the chiral carbon can be depicted as a wedge (bonds to atoms 25 above the plane) and the other can be depicted as a series or wedge of short parallel lines is (bonds to atoms below the plane). The Cahn-Inglod-Prelog system can be used to assign the (R) or (S) configuration to a chiral carbon.

Compounds described herein comprise atoms in both their 30 natural isotopic abundance and in non-natural abundance. The disclosed compounds can be isotopically-labelled or isotopically-substituted compounds identical to those described, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the 35 atomic mass or mass number typically found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine and chlorine, such as <sup>2</sup>H, <sup>3</sup>H, <sup>13</sup>C, <sup>14</sup>C, <sup>15</sup>N, <sup>18</sup>O, <sup>17</sup>O, <sup>35</sup>S, <sup>18</sup>F and <sup>36</sup>Cl, respec-40 tively. Compounds further comprise prodrugs thereof, and pharmaceutically acceptable salts of said compounds or of said prodrugs which contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of this invention. Certain isotopically-labelled compounds of 45 the present invention, for example those into which radioactive isotopes such as <sup>3</sup>H and <sup>14</sup>C are incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e., <sup>3</sup>H, and carbon-14, i.e., <sup>14</sup>C, isotopes are particularly preferred for their ease of preparation and detectability. Fur- 50 ther, substitution with heavier isotopes such as deuterium, i.e., <sup>2</sup>H, can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements and, hence, may be preferred in some circumstances. Isotopically 55 labelled compounds of the present invention and prodrugs thereof can generally be prepared by carrying out the procedures below, by substituting a readily available isotopically labelled reagent for a non-isotopically labelled reagent.

The compounds described in the invention can be present 60 as a solvate. In some cases, the solvent used to prepare the solvate is an aqueous solution, and the solvate is then often referred to as a hydrate. The compounds can be present as a hydrate, which can be obtained, for example, by crystallization from a solvent or from aqueous solution. In this connection, one, two, three or any arbitrary number of solvate or water molecules can combine with the compounds according

to the invention to form solvates and hydrates. Unless stated to the contrary, the invention includes all such possible solvates.

The term "co-crystal" means a physical association of two or more molecules which owe their stability through non-covalent interaction. One or more components of this molecular complex provide a stable framework in the crystalline lattice. In certain instances, the guest molecules are incorporated in the crystalline lattice as anhydrates or solvates, see e.g. "Crystal Engineering of the Composition of Pharmaceutical Phases. Do Pharmaceutical Co-crystals Represent a New Path to Improved Medicines?" Almarasson, O., et. al., The Royal Society of Chemistry, 1889-1896, 2004. Examples of co-crystals include p-toluenesulfonic acid and benzenesulfonic acid.

It is also appreciated that certain compounds described herein can be present as an equilibrium of tautomers. For example, ketones with an  $\alpha$ -hydrogen can exist in an equilibrium of the keto form and the enol form.

$$\begin{array}{c|c} & O & & OH & & \\ \hline \begin{array}{c} & & & \\ \hline \end{array} \\ & & \\ \hline \begin{array}{c} & & \\ & \\ \end{array} \\ \text{keto form} \end{array} \\ \begin{array}{c} & & \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \begin{array}{c} & \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \\ \end{array} \\ \\ \end{array} \\ \begin{array}{c} \\ \\ \\ \end{array} \\ \\ \\ \end{array} \\ \begin{array}{c$$

Likewise, amides with an N-hydrogen can exist in an equilibrium of the amide form and the imidic acid form. As another example, pyrazoles can exist in two tautomeric forms, N¹-unsubstituted, 3-A³ and N¹-unsubstituted, 5-A³ as shown below.

$$A^{5} \xrightarrow{A^{4}} A^{3} \xrightarrow{A^{5}} A^{5} \xrightarrow{A^{4}} A^{3}$$

Unless stated to the contrary, the invention includes all such possible tautomers.

It is known that chemical substances form solids which are present in different states of order which are termed polymorphic forms or modifications. The different modifications of a polymorphic substance can differ greatly in their physical properties. The compounds according to the invention can be present in different polymorphic forms, with it being possible for particular modifications to be metastable. Unless stated to the contrary, the invention includes all such possible polymorphic forms.

In some aspects, a structure of a compound can be represented by a formula:

which is understood to be equivalent to a formula:

$$\mathbb{R}^{n(e)}$$
 $\mathbb{R}^{n(e)}$ 
 $\mathbb{R}^{n(e)}$ 

wherein n is typically an integer. That is,  $R^n$  is understood to represent five independent substituents,  $R^{n(a)}$ ,  $R^{n(b)}$ ,  $R^{n(c)}$ ,  $R^{n(c)}$ ,  $R^{n(d)}$ ,  $R^{n(e)}$ . By "independent substituents," it is meant that 25 each R substituent can be independently defined. For example, if in one instance  $R^{n(a)}$  is halogen, then  $R^{n(b)}$  is not necessarily halogen in that instance.

Certain materials, compounds, compositions, and components disclosed herein can be obtained commercially or 30 readily synthesized using techniques generally known to those of skill in the art. For example, the starting materials and reagents used in preparing the disclosed compounds and compositions are either available from commercial suppliers such as Aldrich Chemical Co., (Milwaukee, Wis.), Acros 35 Organics (Morris Plains, N.J.), Fisher Scientific (Pittsburgh, Pa.), or Sigma (St. Louis, Mo.) or are prepared by methods known to those skilled in the art following procedures set forth in references such as Fieser and Fieser's Reagents for Organic Synthesis, Volumes 1-17 (John Wiley and Sons, 40 1991); Rodd's Chemistry of Carbon Compounds, Volumes 1-5 and Supplementals (Elsevier Science Publishers, 1989); Organic Reactions, Volumes 1-40 (John Wiley and Sons, 1991); March's Advanced Organic Chemistry, (John Wiley and Sons, 4th Edition); and Larock's Comprehensive Organic 45 Transformations (VCH Publishers Inc., 1989).

Unless otherwise expressly stated, it is in no way intended that any method set forth herein be construed as requiring that its steps be performed in a specific order. Accordingly, where a method claim does not actually recite an order to be followed by its steps or it is not otherwise specifically stated in the claims or descriptions that the steps are to be limited to a specific order, it is no way intended that an order be inferred, in any respect. This holds for any possible non-express basis for interpretation, including: matters of logic with respect to arrangement of steps or operational flow; plain meaning derived from grammatical organization or punctuation; and the number or type of embodiments described in the specification.

Disclosed are the components to be used to prepare the 60 compositions of the invention as well as the compositions themselves to be used within the methods disclosed herein. These and other materials are disclosed herein, and it is understood that when combinations, subsets, interactions, groups, etc. of these materials are disclosed that while specific reference of each various individual and collective combinations and permutation of these compounds can not be explicitly

28

disclosed, each is specifically contemplated and described herein. For example, if a particular compound is disclosed and discussed and a number of modifications that can be made to a number of molecules including the compounds are discussed, specifically contemplated is each and every combination and permutation of the compound and the modifications that are possible unless specifically indicated to the contrary. Thus, if a class of molecules A, B, and C are disclosed as well as a class of molecules D, E, and F and an example of a combination molecule, A-D is disclosed, then even if each is not individually recited each is individually and collectively contemplated meaning combinations, A-E, A-F, B-D, B-E, B-F, C-D, C-E, and C-F are considered disclosed. Likewise, any subset or combination of these is also disclosed. Thus, for example, the sub-group of A-E, B-F, and C-E would be considered disclosed. This concept applies to all aspects of this application including, but not limited to, steps in methods of making and using the compositions of the 20 invention. Thus, if there are a variety of additional steps that can be performed it is understood that each of these additional steps can be performed with any specific embodiment or combination of embodiments of the methods of the invention.

It is understood that the compositions disclosed herein have certain functions. Disclosed herein are certain structural requirements for performing the disclosed functions, and it is understood that there are a variety of structures that can perform the same function that are related to the disclosed structures, and that these structures will typically achieve the same result.

3. Muscarinic Acetylcholine Receptor  $\mathbf{M}_1$  Modulation

The human muscarinic acetylcholine receptor  $M_1$  65 (mAChR  $M_1$ ) is a protein of 479 amino acids encoded by the CHRM1 gene. The molecular weight of the unglycosylated

protein is about 51,421 kDa and it is a transmembrane GPCR. As described above, the mAChR M<sub>1</sub> is a member of the GPCR Class 1 family, or the rhodopsin-like GPCRs, which are characterized by structural features similar to rhodopsin such as seven transmembrane segments. The muscarinic acetylcholine receptors have the N-terminus oriented to the extracellular face of the membrane and the C-terminus located on the cytoplasmic face. The orthosteric binding for natural ligand, acetylcholine, for mAChRs is believed to be located within a pocket located within the transmembrane segments. The binding of ligands to the orthosteric and allosteric sites can be distinguished using methods such as those described herein and a variety of other methods known to one skilled in the art.

In one aspect, the disclosed compounds potentiate the agonist response (e.g., acetylcholine) of mAChR M<sub>1</sub>. In a further aspect, the disclosed compounds increase mAChR M<sub>1</sub> response to non-maximal concentrations of agonist in the 20 presence of compound compared to the response to agonist in the absence of compound. The potentiation of mAChR M<sub>1</sub> activity can be demonstrated by methodology known in the art. For example, activation of mAChR M<sub>1</sub> activity can be determined by measurement of calcium flux in response to 25 agonist, e.g. acetylcholine, in cells loaded with a Ca<sup>2+</sup>-sensitive fluorescent dye (e.g., Fluo-4). In a further aspect, the calcium flux was measured as an increase in fluorescent static ratio. In a yet further aspect, positive allosteric modulator activity was analyzed as a concentration-dependent increase 30 in the  $EC_{20}$  acetylcholine response (i.e. the response of mAChR M<sub>1</sub> at a concentration of acetylcholine that yields 20% of the maximal response).

In one aspect, the disclosed compounds activate mAChR  $M_1$  response as an increase in calcium fluorescence in mAChR  $M_1$ -transfected CHO-K1 cells in the presence of the compound, compared to the response of equivalent CHO-K1 cells in the absence of the compound. For example, a disclosed compound can have an EC $_{50}$  of less than about 10  $\mu$ M, of less than about 5  $\mu$ M, of less than about 1  $\mu$ M, of less than about 50 nM. In a further aspect, the mAChR  $M_1$ -transfected CHO-K1 cells are transfected with human mAChR  $M_1$ . In a still further aspect, the mAChR  $M_1$ -transfected CHO-K1 cells are transfected with rat mAChR  $M_1$ .

In one aspect, the disclosed compounds exhibit potentiation of mAChR M<sub>1</sub> response to acetylcholine as an increase in response to non-maximal concentrations of acetylcholine in CHO-K1 cells transfected with a mammalian mAChR M<sub>1</sub> in the presence of the compound, compared to the response to 50 acetylcholine in the absence of the compound. For example, CHO-K1 cells can be transfected with human mAChR M<sub>1</sub>. For example, CHO-K1 cells can be transfected with rat mAChR M<sub>1</sub>. For example, a compound can exhibit positive allosteric modulation of mAChR M<sub>1</sub> with an EC<sub>50</sub> of less than about 10,000 nM, of less than about 5,000 nM. of less than about 1,000 nM, of less than about 500 nM, or of less than about 100 nM. Alternatively, the disclosed compounds exhibit potentiation of mAChR M<sub>1</sub> response to acetylcholine as an increase in response to non-maximal concentrations of acetylcholine in CHO-K1 cells transfected with human mAChR M<sub>1</sub> in the presence of the compound, compared to the response to acetylcholine in the absence of the compound. For example, a compound can exhibit positive allosteric modulation of mAChR M<sub>1</sub> with an EC<sub>50</sub> of less than about 10,000 nM, of less than about 5,000 nM. of less than about 1,000 nM, of less than about 500 nM, of less than about 100 nM, or of less than about 50 nM.

In one aspect, the disclosed compounds are positive allosteric modulators of the mAChR M<sub>1</sub>. Thus, the compounds of the invention can bind to the muscarinic receptor, and particularly to muscarinic receptor subtype M<sub>1</sub>, which results in an increased efficacy at that receptor for the endogenous agonist. Thus, by positive allosteric modulation, the compounds indirectly activate the muscarinic receptor subtype M<sub>1</sub>. In various further aspects, the disclosed compounds exhibit positive allosteric modulation of mAChR M<sub>1</sub> response to acetylcholine as an increase in response to nonmaximal concentrations of acetylcholine in CHO-K1 cells transfected with a mAChR M<sub>1</sub> in the presence of the compound, compared to the response to acetylcholine in the absence of the compound. In a yet further aspect, the disclosed compounds exhibit positive allosteric modulation of 15 the mAChR M<sub>1</sub> response to acetylcholine with an EC<sub>50</sub> of less than about 10,000 nM. In an even further aspect, the disclosed compounds exhibit positive allosteric modulation of the mAChR M<sub>1</sub> response to acetylcholine with an EC<sub>50</sub> of less than about 5,000 nM. In a still further aspect, the disclosed 20 compounds exhibit positive allosteric modulation of the mAChR M<sub>1</sub> response to acetylcholine with an EC<sub>50</sub> of less than about 1,000 nM. In a yet further aspect, the disclosed compounds exhibit positive allosteric modulation of the mAChR M<sub>1</sub> response to acetylcholine with an EC<sub>50</sub> of less 25 than about 500 nM. In an even further aspect, the disclosed compounds exhibit positive allosteric modulation of the mAChR M<sub>1</sub> response to acetylcholine with an EC<sub>50</sub> of less than about 100 nM. In a still further aspect, the  $EC_{50}$  for positive allosteric modulation is determined in CHO-K1 cells 30 are transfected with a mAChR M<sub>1</sub>. In a yet further aspect, the CHO-K1 cells are transfected with a human mAChR M<sub>1</sub>. In a still further aspect, the CHO-K1 cells are transfected with a rat mAChR M1.

Without wishing to be bound by a particular theory, the 35 disclosed compounds and products of the disclosed methods are believed to bind to an allosteric site distinct from the orthosteric binding site. Further, without wishing to be bound by particular theory, the disclosed compounds and products of the disclosed methods can bind to an allosteric site that 40 comprises portions of one or more extracellular loops and/or transmembrane segments, and is distinct from the orthosteric binding site. In a further aspect, without wishing to be bound by a particular theory, the disclosed compounds and products of the disclosed methods can bind to an allosteric site that 45 comprises portions of one or more intracellular loops and/or transmembrane segments, and is distinct from the orthosteric binding site. In a still further aspect, without wishing to be bound by particular theory, the disclosed compounds and products of the disclosed methods can bind to an allosteric 50 site that comprises portions of segments, amino acids, or sub-domains of the mAChR M<sub>1</sub> protein that potentiates interactions of the protein with other proteins, e.g. G-proteins.

Previous attempts to develop agonists that are highly selective for individual mAChR subtypes have failed because of 55 the high conservation of the orthosteric ACh binding site. To circumvent problems associated with targeting the highly conserved orthosteric ACh binding site, it is believed that developing compounds that act at less highly conserved allosteric mAChR sites will afford highly selective activators/ 60 modulators.

In various further aspects, the compound activates mAChR  $\rm M_1$  response in mAChR  $\rm M_1$ -transfected CHO-K1 cells with an EC $_{50}$  less than the EC $_{50}$  for one or more of mAChR  $\rm M_2$ , mAChR  $\rm M_3$ , mAChR  $\rm M_4$ , or mAChR  $\rm M_5$  response in mAChR 65  $\rm M_2$ ,  $\rm M_3$ ,  $\rm M_4$  or  $\rm M_5$ -transfected CHO-K1 cells. That is, a disclosed compound can have selectivity for the mAChR  $\rm M_1$ 

298

receptor vis-à-vis one or more of the mAChR M2, M3, M4 or M<sub>5</sub> receptors. For example, in one aspect, a disclosed compound can activate mAChR M<sub>1</sub> response with an EC<sub>50</sub> of about 5-fold less than that for mAChR M<sub>2</sub>, of about 10-fold less than that for mAChR M<sub>2</sub>, of about 20-fold less than that for mAChR M2, of about 30-fold less than that for mAChR M<sub>2</sub>, of about 50-fold less than that for mAChR M<sub>2</sub>, of about 100-fold less than that for mAChR M<sub>2</sub>, or of >100-fold less than that of that for mAChR M2. In a further aspect, a disclosed compound can activate mAChR M<sub>1</sub> response with an EC<sub>50</sub> of about 5-fold less than that for mAChR M<sub>3</sub>, of about 10-fold less than that for mAChR M<sub>3</sub>, of about 20-fold less than that for M<sub>3</sub>, of about 30-fold less than that for mAChR M<sub>3</sub>, of about 50-fold less than that for mAChR M<sub>3</sub>, of about 100-fold less than that for mAChR M<sub>3</sub>, or of >100-fold less than that of that for mAChR M<sub>3</sub>. In a further aspect, a disclosed compound can activate mAChR M<sub>1</sub> response with an EC<sub>50</sub> of about 5-fold less than that for mAChR M<sub>4</sub>, of about 10-fold less than that for mAChR M<sub>4</sub>, of about 20-fold less than that for  $M_{\perp}$ , of about 30-fold less than that for mAChR M<sub>4</sub>, of about 50-fold less than that for mAChR M<sub>4</sub>, of about 100-fold less than that for mAChR  $M_4$ , or of >100-fold less than that of that for mAChR M4. In a further aspect, a disclosed compound can activate mAChR M<sub>1</sub> response with an EC<sub>50</sub> of about 5-fold less than that for mAChR M<sub>5</sub>, of about 10-fold less than that for mAChR M<sub>5</sub>, of about 20-fold less than that for mAChR M<sub>5</sub>, of about 30-fold less than that for mAChR M<sub>5</sub>, of about 50-fold less than that for mAChR M<sub>5</sub>, of about 100-fold less than that for mAChR M<sub>5</sub>, or of >100fold less than that of that for mAChR M<sub>5</sub>. In a further aspect, a disclosed compound can activate mAChR M<sub>1</sub> response with an EC<sub>50</sub> of about 5-fold less than that for the mAChR  $M_2$ ,  $M_3$ , M<sub>4</sub> or M<sub>5</sub> receptors, of about 10-fold less than that for the mAChR M2, M3, M4 or M5 receptors, of about 20-fold less than that for the mAChR M<sub>2</sub>, M<sub>3</sub>, M<sub>4</sub> or M<sub>5</sub> receptors, of about 30-fold less than that for the mAChR  $M_2$ ,  $M_3$ ,  $M_4$  or  $M_5$ receptors, of about 50-fold less than that for the mAChR M<sub>2</sub>, M<sub>3</sub>, M<sub>4</sub> or M<sub>5</sub> receptors, of about 100-fold less than that for the mAChR M<sub>2</sub>, M<sub>3</sub>, M<sub>4</sub> or M<sub>5</sub> receptors, or of >100-fold than that for the mAChR M<sub>2</sub>, M<sub>3</sub>, M<sub>4</sub> or M<sub>5</sub> receptors. In various further aspects, the compound activates mAChR M<sub>1</sub> response in mAChR M1-transfected CHO-K1 cells and is inactive for one or more of mAChR M<sub>1</sub>, mAChR M<sub>3</sub>, mAChR M<sub>4</sub>, or mAChR M<sub>5</sub> response in mAChR M<sub>2</sub>, M<sub>3</sub>, M<sub>4</sub> or M<sub>5</sub>-transfected CHO-K1 cells.

In various further aspects, the compound activates mAChR M<sub>1</sub> response in M<sub>1</sub>-transfected CHO-K1 cells with an EC<sub>50</sub> of less than about 10 μM and exhibits a selectivity for the M<sub>1</sub> receptor vis-à-vis one or more of the mAChR M<sub>2</sub>, M<sub>3</sub>, M<sub>4</sub> or M<sub>5</sub> receptors. For example, in one aspect, the compound can have an EC $_{50}$  of less than about 10  $\mu M$ , of less than about 5  $\mu$ M, of less than about 1  $\mu$ M, of less than about 500 nM, of less than about 100 nM, or of less than about 50 nM; and the compound can also activate mAChR M<sub>1</sub> response with an EC<sub>50</sub> of about 5-fold less than that for mAChR M<sub>2</sub>, of about 10-fold less than that for mAChR M2, of about 20-fold less than that for mAChR M<sub>2</sub>, of about 30-fold less than that for mAChR M<sub>2</sub>, or of about 50-fold less than that for mAChR  $M_2$ . In certain aspects, the disclosed pharmaceutical compositions comprise the disclosed compounds (including pharmaceutically acceptable salt(s) thereof) as an active ingredient, a 40 pharmaceutically acceptable carrier, and, optionally, other therapeutic ingredients or adjuvants. The instant compositions include those suitable for oral, rectal, topical, and parenteral (including subcutaneous, intramuscular, and intravenous) administration, although the most suitable route in 45 any given case will depend on the particular host, and nature and severity of the conditions for which the active ingredient is being administered. The pharmaceutical compositions can be conveniently presented in unit dosage form and prepared by any of the methods well known in the art of pharmacy.

As used herein, the term "pharmaceutically acceptable salts" refers to salts prepared from pharmaceutically acceptable non-toxic bases or acids. When the compound of the present invention is acidic, its corresponding salt can be conveniently prepared from pharmaceutically acceptable non- 55 toxic bases, including inorganic bases and organic bases. Salts derived from such inorganic bases include aluminum, ammonium, calcium, copper (-ic and -ous), ferric, ferrous, lithium, magnesium, manganese (-ic and -ous), potassium, sodium, zinc and the like salts. Particularly preferred are the 60 ammonium, calcium, magnesium, potassium and sodium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary, and tertiary amines, as well as cyclic amines and substituted amines such as naturally occurring and synthesized substituted 65 amines. Other pharmaceutically acceptable organic nontoxic bases from which salts can be formed include ion

exchange resins such as, for example, arginine, betaine, caffeine, choline, N,N'-dibenzylethylenediamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, isopropylamine, lysine, methylglucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethylamine, trimethylamine, tripropylamine, tromethamine and the like.

As used herein, the term "pharmaceutically acceptable non-toxic acids", includes inorganic acids, organic acids, and salts prepared therefrom, for example, acetic, benzene-sulfonic, benzoic, camphorsulfonic, citric, ethanesulfonic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, pamoic, pantothenic, phosphoric, succinic, sulfuric, tartaric, p-toluenesulfonic acid and the like. In practice, the compounds of the invention, or pharmaceutically acceptable salts thereof, of this invention can be combined as the active ingredient in intimate admixture with a pharmaceutical carrier according to conventional pharmaceutical compounding techniques. The carrier can take a wide variety of forms depending on the form of preparation desired for administration, e.g., oral or parenteral (including intravenous). Thus, the pharmaceutical compositions of the present invention can be presented as discrete units suitable for oral administration such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient. Further, the compositions can be presented as a powder, as granules, as a solution, as a suspension in an aqueous liquid, as a non-aqueous liquid, as an oil-in-water emulsion or as a waterin-oil liquid emulsion. In addition to the common dosage forms set out above, the compounds of the invention, and/or pharmaceutically acceptable salt(s) thereof, can also be administered by controlled release means and/or delivery devices. The compositions can be prepared by any of the methods of pharmacy. In general, such methods include a step of bringing into association the active ingredient with the carrier that constitutes one or more necessary ingredients. In general, the compositions are prepared by uniformly and intimately admixing the active ingredient with liquid carriers or finely divided solid carriers or both. The product can then be conveniently shaped into the desired presentation.

Thus, the pharmaceutical compositions of this invention can include a pharmaceutically acceptable carrier and a compound or a pharmaceutically acceptable salt of the compounds of the invention. The compounds of the invention, or pharmaceutically acceptable salts thereof, can also be included in pharmaceutical compositions in combination with one or more other therapeutically active compounds.

The pharmaceutical carrier employed can be, for example, a solid, liquid, or gas. Examples of solid carriers include lactose, terra alba, sucrose, talc, gelatin, agar, pectin, acacia, magnesium stearate, and stearic acid. Examples of liquid carriers are sugar syrup, peanut oil, olive oil, and water. Examples of gaseous carriers include carbon dioxide and nitrogen.

In preparing the compositions for oral dosage form, any convenient pharmaceutical media can be employed. For example, water, glycols, oils, alcohols, flavoring agents, preservatives, coloring agents and the like can be used to form oral liquid preparations such as suspensions, elixirs and solutions; while carriers such as starches, sugars, microcrystalline cellulose, diluents, granulating agents, lubricants, binders, disintegrating agents, and the like can be used to form oral

solid preparations such as powders, capsules and tablets. Because of their ease of administration, tablets and capsules are the preferred oral dosage units whereby solid pharmaceutical carriers are employed. Optionally, tablets can be coated by standard aqueous or nonaqueous techniques

A tablet containing the composition of this invention can be prepared by compression or molding, optionally with one or more accessory ingredients or adjuvants. Compressed tablets can be prepared by compressing, in a suitable machine, the active ingredient in a free-flowing form such as powder or 10 granules, optionally mixed with a binder, lubricant, inert diluent, surface active or dispersing agent. Molded tablets can be made by molding in a suitable machine, a mixture of the powdered compound moistened with an inert liquid diluent.

The pharmaceutical compositions of the present invention 15 comprise a compound of the invention (or pharmaceutically acceptable salts thereof) as an active ingredient, a pharmaceutically acceptable carrier, and optionally one or more additional therapeutic agents or adjuvants. The instant compositions include compositions suitable for oral, rectal, topical, and parenteral (including subcutaneous, intramuscular, and intravenous) administration, although the most suitable route in any given case will depend on the particular host, and nature and severity of the conditions for which the active ingredient is being administered. The pharmaceutical compositions can be conveniently presented in unit dosage form and prepared by any of the methods well known in the art of pharmacy.

Pharmaceutical compositions of the present invention suitable for parenteral administration can be prepared as solutions or suspensions of the active compounds in water. A suitable surfactant can be included such as, for example, hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, and mixtures thereof in oils. Further, a preservative can be included to prevent the 35 detrimental growth of microorganisms.

Pharmaceutical compositions of the present invention suitable for injectable use include sterile aqueous solutions or dispersions. Furthermore, the compositions can be in the form of sterile powders for the extemporaneous preparation 40 of such sterile injectable solutions or dispersions. In all cases, the final injectable form must be sterile and must be effectively fluid for easy syringability. The pharmaceutical compositions must be stable under the conditions of manufacture and storage; thus, preferably should be preserved against the 45 contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (e.g., glycerol, propylene glycol and liquid polyethylene glycol), vegetable oils, and suitable mixtures thereof.

Pharmaceutical compositions of the present invention can be in a form suitable for topical use such as, for example, an aerosol, cream, ointment, lotion, dusting powder, mouth washes, gargles, and the like. Further, the compositions can be in a form suitable for use in transdermal devices. These 55 formulations can be prepared, utilizing a compound of the invention, or pharmaceutically acceptable salts thereof, via conventional processing methods. As an example, a cream or ointment is prepared by mixing hydrophilic material and water, together with about 5 wt % to about 10 wt % of the 60 compound, to produce a cream or ointment having a desired consistency.

Pharmaceutical compositions of this invention can be in a form suitable for rectal administration wherein the carrier is a solid. It is preferable that the mixture forms unit dose suppositories. Suitable carriers include cocoa butter and other materials commonly used in the art. The suppositories can be

328

conveniently formed by first admixing the composition with the softened or melted carrier(s) followed by chilling and shaping in moulds.

In addition to the aforementioned carrier ingredients, the pharmaceutical formulations described above can include, as appropriate, one or more additional carrier ingredients such as diluents, buffers, flavoring agents, binders, surface-active agents, thickeners, lubricants, preservatives (including antioxidants) and the like. Furthermore, other adjuvants can be included to render the formulation isotonic with the blood of the intended recipient. Compositions containing a compound of the invention, and/or pharmaceutically acceptable salts thereof, can also be prepared in powder or liquid concentrate form.

In the treatment conditions which require positive allosteric modulation of mAChR M<sub>1</sub> receptor activity an appropriate dosage level will generally be about 0.01 to 500 mg per kg patient body weight per day and can be administered in single or multiple doses. Preferably, the dosage level will be about 0.1 to about 250 mg/kg per day; more preferably 0.5 to 100 mg/kg per day. A suitable dosage level can be about 0.01 to 250 mg/kg per day, about 0.05 to 100 mg/kg per day, or about 0.1 to 50 mg/kg per day. Within this range the dosage can be 0.05 to 0.5, 0.5 to 5.0 or 5.0 to 50 mg/kg per day. For oral administration, the compositions are preferably provided in the from of tablets containing 1.0 to 1000 milligrams of the active ingredient, particularly 1.0, 5.0, 10, 15, 20, 25, 50, 75, 100, 150, 200, 250, 300, 400, 500, 600, 750, 800, 900 and 1000 milligrams of the active ingredient for the symptomatic adjustment of the dosage of the patient to be treated. The compound can be administered on a regimen of 1 to 4 times per day, preferably once or twice per day. This dosing regimen can be adjusted to provide the optimal therapeutic response.

It is understood, however, that the specific dose level for any particular patient will depend upon a variety of factors. Such factors include the age, body weight, general health, sex, and diet of the patient. Other factors include the time and route of administration, rate of excretion, drug combination, and the type and severity of the particular disease undergoing therapy.

The present invention is further directed to a method for the manufacture of a medicament for modulating mAChR  $\rm M_1$  receptor activity (e.g., treatment of one or more neurological and/or psychiatric disorder associated with mAChR  $\rm M_1$  receptor dysfunction) in mammals (e.g., humans) comprising combining one or more disclosed compounds, products, or compositions with a pharmaceutically acceptable carrier or diluent. Thus, in one aspect, the invention relates to a method for manufacturing a medicament comprising combining at least one disclosed compound or at least one disclosed product with a pharmaceutically acceptable carrier or diluent.

# 1. General Methods

<sup>1</sup>H NMR spectra were recorded either on a Bruker DPX-400 or on a Bruker AV-500 spectrometer with standard pulse sequences, operating at 400 MHz and 500 MHz respectively. Chemical shifts (6) are reported in parts per million (ppm) downfield from tetramethylsilane (TMS), which was used as internal standard. Coupling constants (J-values) are expressed in Hz units.

Microwave assisted reactions were performed in a single-mode reactor: Emrys<sup>TM</sup> Optimizer microwave reactor (Personal Chemistry A.B., currently Biotage).

Flash column chromatography was performed using ready-to-connect cartridges from: (a) ISCO, on irregular silica gel, particle size 15-40 µm (normal layer disposable flash columns) on a Companion system from ISCO, Inc.; or, (b) Merck, on irregular silica gel, particle size 15-40 µm (normal layer disposable flash columns) on an SPOT or LAFLASH system from Armen Instrument.

Analytical HPLC was performed on an HP1100 with UV detection at 214 and 254 nm along with ELSD detection and low resolution mass spectra using an Agilent 1200 series 6130 mass spectrometer.

# 2. LC-MS Methods

The UPLC (Ultra Performance Liquid Chromatography) measurement was performed using an Acquity UPLC (Wa-

ters) system comprising a sampler organizer, a binary pump with degasser, a four column's oven, a diode-array detector (DAD) and a column as specified below. Column flow was used without split to the MS detector. The MS detector was configured with an ESCI dual ionization source (electrospray combined with atmospheric pressure chemical ionization). Nitrogen was used as the nebulizer gas. The source temperature was maintained at 140° C. Data acquisition was performed with MassLynx-Openlynx software. [M+H], means the protonated mass of the free base of the compound and where indicated  $R_{\tau}$  means retention time (in minutes).

In the LC-MS analysis, reversed phase HPLC was carried out on an Agilent 1200 with a Kinetex C18 column (2.6  $\mu m, 2.1\times30\,$  mm) from Phenomenex, with a flow rate of 1.5 mL/min, at 45° C. The gradient conditions used are: 93% A (0.1% TFA in water), 7% B (acetonitrile), to 5% A, 95% B in 1.1 minutes. Injection volume was 3.0  $\mu l.$  Low-resolution ES positive mass spectra (single quadrupole, Agilent 6130) were acquired by scanning from 100 to 700 in 0.25 seconds. The capillary needle voltage was 3 kV.

The organic washes were combined, dried over Na2SO4, filtered and concentrated in vacuo. The crude solids were used without further purification. In a round bottom flask purged with argon, 40 fitted with a stir bar and a septa, N-(1-(4-bromobenzyl)-2oxoindolin-3-ylidene)-2-methylpropane-2-sulfinamide (60 mg, 0.15 mmol) was dissolved in THF (2 mL) and cooled to -78° C. A solution of 2-(1,3-dioxan-2-yl)ethyl)magnesium bromide in THF (0.5M, 0.18 mmol) was added drop wise at 45 -78° C. The solution was stirred for 1 h at -78° C., warmed to ambient temperature, and stirred for an additional hour. The mixture was diluted with dichloromethane (15 mL) and a saturated NH<sub>4</sub>Cl solution (15 mL) was added. The mixture was passed through a phase separator and the organic phase 50 was concentrated in vacuo. The resulting oil was used without further purification. (±)-N-(3-(2-(1,3-dioxan-2-yl)ethyl)-1-(4-bromobenzyl)-2-oxoindolin-3-yl)-2-methylpropane-2sulfinamide (72 mg, 0.14 mmol) was dissolved in dioxane and the solution was cooled to 0° C. A solution of HCl in dioxane 55 (4N, 1.4 mmol) was added and the mixture was stirred at ambient temperature for 30 min. The mixture was concentrated in vacuo and the residue was re-dissolved in dichloroethane (DCE, 1.5 mL). Sodium triacetoxyborohydride [NaB-H(OAc)<sub>3</sub>, 43 mg, 0.21 mmol] was added and the mixture was 60 stirred at ambient temperature for 1 h. The mixture was diluted with dichloromethane (10 mL) and a saturated NaHCO<sub>3</sub> solution (10 mL) was added. The mixture was vigorously shaken and passed through a phase separator. The organic phase was concentrated in vacuo and the resulting oil 65 was used without further purification. In a conical vial fitted with a stir bar, (±)-1-(4-bromobenzyl)spiro[indoline-3,2'pyrrolidin]-2-one (10 mg, 0.03 mmol) was suspended in H<sub>2</sub>O

(diphenylphosphino)ferrocene]dichloropalladium (II) (6 mg, 0.007 mmol) were added. The reaction vial was sealed and heated to  $160^{\circ}$  C. under microwave irradiation. The vial was cooled to ambient temperature and the mixture was diluted with dichloromethane (15 mL) and a saturated NaHCO<sub>3</sub> solution (5 mL) was added. The mixture was vigorously stirred and passed through a phase separator. The organic phase was

concentrated in vacuo and the residue was purified on a preparative Phenomenex Gemini C18 column using 0.5 mL/L  $\,^{25}$  NH<sub>4</sub>OH in H<sub>2</sub>O/acetonitrile as a mobile phase. The desired

In a round bottom flask purged with argon, fitted with a stir bar and a septa, 1-(4-bromobenzyl)indoline-2,3-dione (300 mg, 0.95 mmol) and allyltrimethylsilane (302 µL, 1.90 mmol) were dissolved in dichloromethane (10 mL). The solution was cooled to 0° C. Tin (IV) tetrachloride (133 μL, 1.2 mmol) was added drop wise to the solution. This mixture was stirred at  $0^{\circ}$  C. for 5 h. Then, the mixture was diluted with DCM (10 mL) and a 2N aqueous solution of HCl (10 mL) was added. 35 The biphasic mixture was transferred to a reparatory funnel and the phases were separated. The aqueous layer was extracted with DCM (3×10 mL). The organic fractions were combined, dried over Na2SO4, filtered and concentrated in vacuo. The residue was purified on silica gel using EtOAc in 40 hexanes as a mobile phase. The desired fractions were combined and concentrated in vacuo to provide the target compound. In a round bottom flask, fitted with a stir bar, a reflux condenser, and a septa,  $(\pm)$ -1'-(4-bromobenzyl)-4-(trimethylsilyl)-4,5-dihydro-3H-spiro[furan-2,3'-indolin]-2'-one (407 45 mg, 0.95 mmol) was dissolved in THF (10 mL). A solution of tetrabutylammonium fluoride in THF (1M, 4.8 mmol) was added and the mixture was heated to 60° C. for 18 h. The mixture was cooled to ambient temperature and diluted with DCM (20 mL). ### 16. Cell Lines Expressing Muscarinic Acetylcholine Receptors

Chinese hamster ovary (CHO-K1) cells stably expressing 25 rat (r)M<sub>1</sub> were purchased from the American Type Culture Collection and cultured according to their indicated protocol. CHO cells stably expressing human (h)M<sub>2</sub>, hM<sub>3</sub>, and hM<sub>5</sub> were described previously (Levey et al., 1991);  $hM_1$  and  $hM_{4-30}$ cDNAs were purchased from Missouri S&T cDNA Resource; rM<sub>4</sub> cDNA was provided by T. I. Bonner (National Institutes of Health, Bethesda, Md.). rM2 and rM3 were cloned from a rat brain cDNA library and sequence verified. transfect CHO-K1 cells purchased from the American Type Culture Collection using Lipofectamine-2000. To make stable rM<sub>2</sub>, hM<sub>2</sub>, rM3, hM<sub>4</sub>, and rM<sub>4</sub> cell lines for use in calcium mobilization assays, these cells also were stably transfected with a chimeric G-protein ( $G_{qi5}$ ) (provided by B. 40 R. Conklin, University of California, San Francisco) using Lipofectamine 2000. rM<sub>1</sub>, hM<sub>1</sub>, rM<sub>3</sub>, hM<sub>3</sub>, rM<sub>5</sub>, and hM<sub>5</sub> cells were grown in Ham's F-12 medium containing 10% heat-inactivated fetal bovine serum (FBS), 20 mM HEPES, and 50  $\mu g/mL$  G418 sulfate. rM2-G $_{qi5}$ , hM $_2$ -G $_{qi5}$ , and hM $_4$ - 45  $G_{ai5}$  cells were grown in the same medium also containing  $500 \,\mu\text{g/mL}$  Hygromycin B. Stable rM<sub>4</sub>-G<sub>ai5</sub> cells were grown in DMEM containing 10% heat-inactivated FBS, 20 mM HEPES, 400 μg/mL G418 sulfate, and 500 μg/mL Hygromy-

### 17. Cell-Based Functional Assay of Muscarinic Acetylcholine Receptor Activity

For high throughput measurement of agonist-evoked 55 increases in intracellular calcium, CHO-K1 cells stably expressing muscarinic receptors were plated in growth medium lacking G418 and hygromycin at 15,000 cells/20 μL/well in Greiner 384-well black-walled, tissue culture (TC)-treated, clear-bottom plates (VWR). Cells were incu- 60 bated overnight at 37° C. and 5% CO<sub>2</sub>. The next day, cells were washed using an ELX 405 (BioTek) with four washes  $(80 \,\mu\text{L})$  of assay buffer then aspirated to  $20 \,\mu\text{L}$ . Next,  $20 \,\mu\text{L}$  of 16 µM Fluo-4/acetoxymethyl ester (Invitrogen, Carlsbad, Calif.) prepared as a 2.3 mM stock in DMSO and mixed in a 65 1:1 ratio with 10% (w/v) Pluronic F-127 and diluted in assay buffer was added to the wells and the cell plates were incu-

bated for 50 min at 37° C. and 5% CO<sub>2</sub>. Dye was removed by washing with the ELX 405 (four 80 μL washes of assay buffer) then aspirated to 20 μL. Compound master plates were formatted in an 11 point CRC format (1:3 dilutions) in 100% DMSO with a starting concentration of 10 mM using the BRAVO liquid handler (Agilent). Test compound CRCs were then transferred to daughter plates (240 mL) using the Echo acoustic plate reformatter (Labcyte, Sunnyvale, Calif.) and then diluted into assay buffer (40  $\mu L$ ) to a 2× stock using a Thermo Fisher Combi (Thermo Fisher Scientific, Waltham, Mass.).

Calcium flux was measured using the Functional Drug hM<sub>1</sub>, rM<sub>2</sub>, rM<sub>3</sub>, hM<sub>4</sub>, and rM<sub>4</sub> cDNAs were used to stably 35 Screening System (FDSS) 6000 (Hamamatsu Corporation, Tokyo, Japan) as an increase in the fluorescent static ratio. Compounds were applied to cells (20 µL, 2×) using the automated system of the FDSS 6000 at 4 s into the 300 s protocol and the data were collected at 1 Hz. At 144 s into the 300 s protocol, 10 μL of an EC<sub>20</sub> concentration of the muscarinic receptor agonist acetylcholine was added (5x), followed by the addition of 12  $\mu$ L an EC<sub>80</sub> concentration of acetylcholine at the 230 s time point  $(5\times)$ . Agonist activity was analyzed as a concentration-dependent increase in calcium mobilization upon compound addition. Positive allosteric modulator activity was analyzed as a concentration-dependent increase in the EC<sub>20</sub> acetylcholine response. Antagonist activity was analyzed as a concentration-dependent decrease in the EC80 acetylcholine response. Concentration-response curves were generated using a four-parameter logistical equation in XLfit curve fitting software (IDBS, Bridgewater, N.J.) for Excel (Microsoft, Redmond, Wash.) or Prism (GraphPad Software, Inc., San Diego, Calif.).

The above described assay was also operated in a second mode where an appropriate fixed concentration of the present compounds were added to the cells after establishment of a fluorescence baseline for about 3 seconds, and the response in cells was measured. 140 s later the appropriate concentration of agonist was added and readings taken for an additional 106 s. Data were reduced as described above and the  $\mathrm{EC}_{50}$  values for the agonist in the presence of test compound were determined by nonlinear curve fitting. A decrease in the EC<sub>50</sub> value of the agonist with increasing concentrations of the present compounds (a leftward shift of the agonist concentrationresponse curve) is an indication of the degree of muscarinic positive allosteric modulation at a given concentration of the present compound. An increase in the EC<sub>50</sub> value of the ago-

nist with increasing concentrations of the present compounds (a rightward shift of the agonist concentration response curve) is an indication of the degree of muscarinic antagonism at a given concentration of the present compound. The second mode also indicates whether the present compounds also affect the maximum response of the muscarinic receptor to agonists.

The calcium mobilization assay was also used to determine "efficacy". In the context of the assays carried out for the data in Table II, "efficacy" (% ACh at 30  $\mu M$ ) is defined as the maximal response in the calcium flux as determined by the sigmoidal curve fit of the concentration response curve, or in the absence of an acceptable curve fit, the response recorded at 30  $\mu M$  test compound, stated as a percentage of the response elicited by a concentration of Ach that induces approximately 80% of a maximal (i.e. saturating) ACh response.

#### 18. Activity of Compounds in Cell-Based Assays

Substituted benzylspiroindolin-2-one analogs were synthesized as described above. Activity (EC<sub>50</sub> and E<sub>max</sub>) was determined in the mAChR  $M_1$  cell-based functional assay as described above and the data are shown in Table III. The compound number corresponds to the compound numbers <sup>2</sup> used in Tables I and II.

\*% ACh maximum at 30 µM

50

For compounds showing low potency (as indicated by a lack of a plateau in the concentration response curve) but greater than a 20% increase in ACh response, a potency of 10 μM (pEC<sub>50</sub><5) is estimated.

The selectivity of the disclosed compounds for mAChR  $M_1$  compared to mAChR  $M_2$ ,  $M_3$ ,  $M_4$ , and  $M_5$  was determined using the cell-based functional assay described below using the appropriate cell-lines (prepared as described below). The  $EC_{50}$  for each of mAChR  $M_2$ ,  $M_3$ ,  $M_4$ , and  $M_5$  was greater than at least 30  $\mu$ M for representative compounds (I.e., there was no receptor response up to a concentration of about 30  $\mu$ M, the upper limit of compound used in the assay).

# 19. Prophetic Pharmaceutical Composition Examples

"Active ingredient" as used throughout these examples relates to one or more disclosed compounds or products of disclosed methods of making as described hereinbefore, or a pharmaceutically acceptable salt, hydrate, solvate, or polymorph thereof.

The following examples of the formulation of the compounds of the present invention in tablets, suspension, injectables and ointments are prophetic. Typical examples of recipes for the formulation of the invention are as given below.

Typical examples of recipes for the formulation of the invention are as given below. Various other dosage forms can be applied herein such as a filled gelatin capsule, liquid emulsion/suspension, ointments, suppositories or chewable tablet form employing the disclosed compounds in desired dosage

amounts in accordance with the present invention. Various conventional techniques for preparing suitable dosage forms can be used to prepare the prophetic pharmaceutical compositions, such as those disclosed herein and in standard reference texts, for example the British and US Pharmacopoeias, Remington's Pharmaceutical Sciences (Mack Publishing Co.) and Martindale The Extra Pharmacopoeia (London The Pharmaceutical Press).

The disclosure of this reference is hereby incorporated herein by reference.

a. Pharmaceutical Composition for Oral Administration A tablet can be prepared as follows:

Component	Amount
Active ingredient	10 to 500 mg
Lactose	100 mg
Crystalline cellulose	60 mg
Magnesium stearate	5
Starch (e.g. potato starch)	Amount necessary to yield total weight indicated below
Total (per capsule)	1000 mg

Alternatively, about 100 mg of a disclosed compound, 50 mg of lactose (monohydrate), 50 mg of maize starch (native), 10 mg of polyvinylpyrrolidone (PVP 25) (e.g. from BASF, Ludwigshafen, Germany) and 2 mg of magnesium stearate are used per tablet. The mixture of active component, lactose and starch is granulated with a 5% solution (m/m) of the PVP in water. After drying, the granules are mixed with magnesium stearate for 5 min. This mixture is moulded using a customary tablet press (e.g. tablet format: diameter 8 mm, curvature radius 12 mm). The moulding force applied is typically about 15 kN.

Alternatively, a disclosed compound can be administered in a suspension formulated for oral use. For example, about 100-5000 mg of the desired disclosed compound, 1000 mg of ethanol (96%), 400 mg of xanthan gum, and 99 g of water are combined with stirring. A single dose of about 10-500 mg of 40 the desired disclosed compound according can be provided by 10 ml of oral suspension.

In these Examples, active ingredient can be replaced with the same amount of any of the compounds according to the present invention, in particular by the same amount of any of the exemplified compounds. In some circumstances it may be desirable to use a capsule, e.g. a filled gelatin capsule, instead of a tablet form. The choice of tablet or capsule will depend, in part, upon physicochemical characteristics of the particular disclosed compound used.

Examples of alternative useful carriers for making oral preparations are lactose, sucrose, starch, talc, magnesium stearate, crystalline cellulose, methyl cellulose, hydroxypropyl cellulose, hydroxypropylmethyl cellulose, carboxymethyl cellulose, glycerin, sodium alginate, gum arabic, etc. These alternative carriers can be substituted for those given above as required for desired dissolution, absorption, and manufacturing characteristics.

The amount of a disclosed compound per tablet for use in a pharmaceutical composition for human use is determined from both toxicological and pharmacokinetic data obtained in suitable animal models, e.g. rat and at least one non-rodent species, and adjusted based upon human clinical trial data. For example, it could be appropriate that a disclosed compound is present at a level of about 10 to 1000 mg per tablet dosage unit.

b. Pharmaceutical Composition for Injectable Use A parenteral composition can be prepared as follows:

Component	Amount *	
Active ingredient	10 to 500 mg	
Sodium carbonate	560 mg*	
Sodium hydroxide	80 mg*	
Distilled, sterile water	Quantity sufficient to prepare total volumen indicated below.	
Total (per capsule)	10 ml per ampule	

\* Amount adjusted as required to maintain physiological pH in the context of the amount of active ingredient, and form of active ingredient, e.g. a particular salt form of the active ingredient.

Alternatively, a pharmaceutical composition for intravenous injection can be used, with composition comprising about 100-5000 mg of a disclosed compound, 15 g polyethylenglycol 400 and 250 g water in saline with optionally up to about 15% Cremophor EL, and optionally up to 15% ethyl alcohol, and optionally up to 2 equivalents of a pharmaceutically suitable acid such as citric acid or hydrochloric acid are used. The preparation of such an injectable composition can be accomplished as follows: The disclosed compound and the polyethylenglycol 400 are dissolved in the water with stirring. The solution is sterile filtered (pore size 0.22 μm) and filled into heat sterilized infusion bottles under aseptic conditions. The infusion bottles are sealed with rubber seals.

In a further example, a pharmaceutical composition for intravenous injection can be used, with composition comprising about 10-500 mg of a disclosed compound, standard saline solution, optionally with up to 15% by weight of Cremophor EL, and optionally up to 15% by weight of ethyl alcohol, and optionally up to 2 equivalents of a pharmaceutically suitable acid such as citric acid or hydrochloric acid. Preparation can be accomplished as follows: a desired disclosed compound is dissolved in the saline solution with stirring. Optionally Cremophor EL, ethyl alcohol or acid are added. The solution is sterile filtered (pore size 0.22 µm) and filled into heat sterilized infusion bottles under aseptic conditions. The infusion bottles are sealed with rubber seals.

In this example, active ingredient can be replaced with the same amount of any of the compounds according to the present invention, in particular by the same amount of any of the exemplified compounds.

The amount of a disclosed compound per ampule for use in a pharmaceutical composition for human use is determined from both toxicological and pharmacokinetic data obtained in suitable animal models, e.g. rat and at least one non-rodent species, and adjusted based upon human clinical trial data. For example, it could be appropriate that a disclosed compound is present at a level of about 10 to 1000 mg per tablet dosage unit.

Carriers suitable for parenteral preparations are, for example, water, physiological saline solution, etc. which can be used with tris(hydroxymethyl)aminomethane, sodium carbonate, sodium hydroxide or the like serving as a solubilizer or pH adjusting agent. The parenteral preparations contain preferably 50 to 1000 mg of a disclosed compound per dosage unit.
